The word "alien" is often used to describe a life-form from another planet. No one knows for sure if life exists elsewhere in the universe, but some scientists think it might be possible.

People have been fascinated by the idea of aliens for a long time. Many enjoy science fiction stories about these extraterrestrial beings. Some people even believe that aliens have visited Earth. They report seeing strange objects in the sky, which some think are alien spaceships. However, no one has ever proven that aliens have been to Earth.

Most scientists agree that for a planet to have life, it needs to be similar to Earth. It should have an atmosphere and water, and it must orbit a star, like the Sun, at the right distance. This distance ensures that the planet gets the right amount of light and heat for life.

Scientists have studied planets and moons in our Solar System to see if they could support life. Space probes have looked for tiny living things on Mars. Some scientists are also searching for life outside our Solar System. They use radio telescopes to try to detect signals from intelligent aliens.

So far, no evidence of extraterrestrial life has been found. However, scientists have discovered many new planets around distant stars. Some of these planets are at a good distance from their stars and are similar in size to Earth. It's possible that life could exist on some of these planets.

Question 27. What is the main topic of the passage?

- A. The conditions needed for life on other planets B. The discovery of new planets
